Task 2 — gRPC real translate round-trip on nezha (§11.4.107 real content)

Run UTC: 20260616T143649Z **Surface:** gRPC nezha.local:50061 TranslationService (image 2d0c925, post-fix) **Client:** cmd/grpc-translate-probe/main.go (standalone wire-protocol client; built to /tmp, NOT committed as a binary) **Provider:** deepseek (key present in grpc container; bridge selects strongest verified model)

Flow (StartTranslation → poll GetTranslationStatus → read output file)

1. Staged real Russian input into the grpc container: /tmp/grpc_in.txt (via podman cp).
2. StartTranslation(input=/tmp/grpc_in.txt, output=/tmp/grpc_out.epub, src=ru, dst=sr, provider=deepseek) → status started.
3. Polled GetTranslationStatus every 3s: running 50% → completed 100% in **3m21s**.
4. Completed status reported 3 Files: original_md, translated_md, epub.

Real content (§11.4.107 — not placeholder)

	Text
Original (RU)	Доброе утро. Меня зовут Иван. Я живу в большом городе. Сегодня хорошая погода, и я хочу пойти на прогулку в парк.
Translated (SR)	Добар дан. Зовем се Иван. Живим у великом граду. Данас је лепо време, а хтео сам да одем на шетњу у парк.

Genuine fluent Serbian Cyrillic — correct translation of the source.

EPUB artifact (§11.4.38 — open + verify)

- file → EPUB document; valid zip with mimetype, META-INF/container.xml, OEBPS/content.opf, toc.ncx, chapter1.xhtml (5 files, 1759 B).
- OEBPS/chapter1.xhtml contains the real Serbian translation: **PASS** (grep "Зовем се Иван" matched).

Verdict: PASS — gRPC async file-job translate works end-to-end on the live stack with real LLM output and a valid translated EPUB.
