Task 1 — Live re-validation of fix 6a1aa8c on nezha (§11.4.108 PENDING → DONE)

Run UTC: 20260616T142656Z **Main checkout HEAD:** 6a1aa8c **Live image BEFORE reboot:** f3904ccd71c2 (pre-fix) **Live image AFTER reboot:** 2d0c925325e3 (contains fix; IsKnownProvider gate) **Surface:** server-TLS <https://nezha.local:18443/api/v1/translate> **Deploy:** rsync fixed source → nezha:~/helixtranslate, then bash scripts/nezha-deploy.sh reboot server api-server (image id changed f3904ccd→2d0c925, runtime signature = behavior below).

RED baseline (pre-fix binary f3904ccd) — the bug

Case	HTTP	Body
provider:"unsupported-provider"	200 (BUG)	silent substitution → provider:"llm-novita", translated:"Привет, свет"
provider:"deepseek" (valid)	200	real translation via bridge (provider:"llm-novita")

GREEN (post-fix binary 2d0c925) — fix proven, no regression

Case	HTTP	Body	Verdict
provider:"unsupported-provider"	400	{"error":"unsupported provider: unsupported-provider"}	PASS — bug fixed
provider:"totally-made-up-xyz"	400	{"error":"unsupported provider: totally-made-up-xyz"}	PASS — gate variety
provider:"deepseek" (valid)	200	translated:"Добро јутро, како стача?" (real Serbian)	PASS — no regression

Case	HTTP	Body	Verdict
empty provider (default)	200	translated:"Књига лежи на столу." (real Serbian)	PASS — no regression

RED→GREEN polarity flip proven on the clean new artifact (§11.4.115 + §11.4.108 runtime-signature = the live 400/200 behavior).

Notes

- The provider response field reports `llm-novita` because the LLMsVerifier bridge selects the strongest verified model regardless of the (admitted) requested provider name — documented design (`handler.go createTranslator` comment). The fix gates *admission* (known→pass, unknown→400), not model selection.
- The server binary blocks ~3.5 min at startup on `bridge.Open` (5m30s timeout) while selecting verified models from real providers — NOT a crash/regression; it bound successfully and is HEALTHY. Container healthcheck label lags (30s interval) but the endpoint serves 200.
- `api-server :18080` returns 404 for `/api/v1/translate` (different route set on that container); `server-TLS :18443` is the canonical translate surface.
