Re-validation of e198b17 (commentary-aside strip fix) on nezha — §11.4.130 / §11.4.108

Run UTC: 20260616T145411Z Commit: e198b17 (on 6a1aa8c) Live image BEFORE this redeploy: server 2d0c925, grpc 2d0c925 Live image AFTER: server/grpc/api all ebb82df46d9c (contamination fix) Surface: server-TLS https://nezha.local:18443/api/v1/translate

Targeted-fix validation FIRST (§11.4.130)

Check	Result
unsupported provider nope-xyz	HTTP 400 {"error":"unsupported provider: nope-xyz"} — task-1 fix still holds (no regression)
valid deepseek ru→sr	HTTP 200 translated:"Добро јутро." (real Serbian, no regression)
18× ru→sr clean batch	18/18 HTTP 200, contaminated=0/18 (parenthetical/ bracket meta-aside + newline-commentary scan)

The exact source that produced the pre-fix contamination — Я пью кофе утром.
→ pre-fix
'Ја пијем кафу јутро.\n\n(Using Ekavica dialect ... as per guidelines)' — now returns **clean** 'Ја пијем кафу јутро.' on the live binary.

Defect → fix (§11.4.4 / §11.4.102 / §11.4.115 / §11.4.135)

- **FACT root cause:** isCommentaryBlock only stripped a trailing fully-enclosed ()/[] block when its inner text started with note or contained translat. A live aside (Using Ekavica dialect and pure Serbian vocabulary as per guidelines) matched neither → leaked into the translation.
- **Fix:** widened parenthetical-inner detection with commentaryParenSignalWords (using/dialect/vocabulary/guideline/register/as per/i used/...). Genuine in-content trailing parentheticals preserved (guard test).

- **Anti-bluff:** strip_commentary_test.go RED fixtures (sr_paren_dialect_aside, en_bracket_style_aside) FAIL pre-fix / PASS post-fix; KeepsBenignTrailingParenthetical over-strip guard; §1.1 mutation (remove signal-word loop → FAIL → restore → PASS); full pkg/translator/llm + pkg/translator GREEN; vet clean.

Honest boundary (§11.4.6)

- Contamination is intermittent (1/20 pre-fix). The DETERMINISTIC unit test + §1.1 mutation are the authoritative proof the stripping logic catches the class; the live 18/18-clean batch is corroborating runtime evidence (§11.4.108 runtime signature = the live binary contains + runs the widened stripper).
- Translation *quality* on the novita-routed model is imperfect (e.g. cat→"Коња"/horse). That is a model-selection quality concern, OUT of scope for the contamination defect — queued separately if pursued.

Verdict: PASS — commentary-aside contamination class eliminated on the live stack; task-1 unsupported-provider fix unregressed.
