

EVIDENCE

§11.4.153 Real-Use Video Recording — WAVE 5

Revision: 1 **Last modified:** 2026-06-16T17:45:00Z **Run-id:**

video_wave5_20260616-173814 **Authority:** §11.4.153 (per-feature video confirmation), §11.4.107 (liveness/real-content), §11.4.154 (window-scoped + fresh-corpus), §11.4.155 (helix_translate- project-name prefix), §11.4.6 (no-guessing — only "confirmed" what a real video proves). **Stream:** Background OPERATOR-AUTHORIZED non-committing parallel stream. This agent did NOT commit / stage / git add (§11.4.84/§11.4.119 — a separate committer agent owns the main checkout).

Environment (§11.4.6)

- Main checkout HEAD: 6a1aa8c (matched at start).
- DEEPSEEK_API_KEY set (verified, never printed); GR0Q_API_KEY set.
- Path used: **default in-process bridge translate path** (NOT -use-verifier — LLMsVerifier at localhost:8080 unreachable this session).
- Build: go build -o build/unified-translator ./cmd/unified-translator → OK (gitignored, NOT staged). go build -o build/server ./cmd/server → OK.
- Recording toolchain: asciinema rec -c "<cmd>" → agg --fps-cap 30 → ffmpeg fps=2 -r 2 yuv420p even-dims, window-scoped (terminal pane only).
- Recordings dir: /Volumes/T7/Downloads/Recordings/ — wave5 filenames distinct (helix_translate-<feature>-wave5-20260616-173814.mp4); **NO prior helix_translate-* files deleted** (they are distinct prior-wave evidence, not this agent's own stale dups; distinct wave5 naming avoids collision per §11.4.154).
- Live REST server (scenarios 4-5): cmd/server on 127.0.0.1:9543 (fresh port, /tmp config copy), stopped after recording (§11.4.14 cleanup).

CONFIRMED features (5 net-new, distinct from waves 1-4)

Waves 1-4 covered: many providers, DOCX/PDF/HTML→MD output, EPUB→EPUB, TXT→TXT, FB2→FB2, format-detect, CLI -script Cyrillic↔Latin, REST/gRPC text translate, markdown round-trip, verify-models CLI, workable-items CLI, EN→FR/DE/IT/ES, RU→SR. Wave 5 picks 5 genuinely-distinct NOT-yet-confirmed features.

#	Feature	Video	Real output read from output frame (§11.4.107)
1	unified-translator EN→PT (Portuguese) — new language pair	helix_translate-en-pt-translate-wave5-20260616-173814.mp4 (9 frames, 4.5s, 790×560 yuv420p)	INPUT English → OUTPUT Portuguese: "O antigo farol erguia-se sozinho na praia rochosa. Sua luz guiava navios seguros de volta para casa, mesmo durante a tempestade. O guarda subia as escadas todas as noites." (start-frame English ≠ output-frame Portuguese)
2	unified-translator EN→JA (Japanese) — new language pair, non-Latin output	helix_translate-en-ja-translate-wave5-20260616-173814.mp4 (9 frames, 4.5s)	INPUT English → OUTPUT Japanese: "古い灯台は、岩盤の海岸にひとりで立ち並んでいた。灯火は嵐のなかでも船を安全に帰港に導いていた。守り人はいずれの夜も階段を登り、灯台を守っていた。" (start-frame Latin ≠ output-frame Japanese script)
3	-multipass multi-pass LLM polishing engine (run with -model deepseek-chat)	helix_translate-multipass-polishing-wave5-20260616-173814.mp4 (16 frames, 8.0s)	Session report Step 4: "Multi-pass Polishing  Success — Duration: 27.016265041s — Polished over 1 pass(es) with deepseek" + polished Spanish output. The 27s is genuine extra LLM polishing work (the engine pkg/verification actually ran), not a no-op.
4	REST POST / api/v1/convert/script (Cyrillic↔Latin, deterministic) — distinct from CLI -script	helix_translate-rest-convert-script-wave5-20260616-173814.mp4 (6 frames, 3.0s)	Real JSON both directions: Cyrillic→Latin { "converted": "Sistem treba prevesti", "original": "Систем треба превести", "target": "latin" }; Latin→Cyrillic { "converted": "Ово је тестни текст", "original": "Ovo je testni tekst", "target": "cyrillic" } (original ≠ converted)
5	REST POST / api/v1/translate/fb2	helix_translate-rest-translate-fb2-wave5-20260616-173814.mp4 (16 frames, 8.0s)	INPUT FB2 (English) → POST → valid EPUB (2016 bytes, mimetype application/epub+zip, proper OEBPS) → extracted chapter text

#	Feature	Video	Real output read from output frame (§11.4.107)
	→ real translated EPUB		REAL Serbian: "Стари свјетионич стоје сам на каменитој обали. Његова светлост водило бродове безбедно кући кроз олују." (input English ≠ output Serbian)

All 5 output frames were READ (not assumed) and copied into frames/. The FB2 output EPUB sample is in frames/fb2_output_sample.epub.

Honest characterizations / findings (§11.4.6 — NOT bluffed)

- **–multipass default-model is BROKEN (§11.4.146 finding, real bug):** with the DEFAULT model gpt-4, multipass fails — session report shows Step 4 "Multi-pass polishing **failed**, keeping base translation: model 'gpt-4' is not valid for provider 'deepseek'. Valid models: [deepseek-chat deepseek-coder deepseek-v4-flash deepseek-v4-pro]" (the polisher's VerifiedFactory→NewLLMTranslatorWithConfig ValidModels whitelist rejects the default model — same whitelist class as the Wave-1 bridge-translator blocker). The base translation correctly survives. **multipass is confirmed working ONLY when invoked with an explicit valid model** (–model deepseek-chat). The default-gpt-4-multipass path is a real defect worth a tracked fix; a video of the default path would have shown failure, so it was NOT used for the confirmation.
- **POST /api/v1/translate/fb2 ignores target_lang/source_lang form fields:** the handler (pkg/api/handler.go:84–85) is HARDCODED sourceLang=ru, targetLang=sr (Serbian). So the endpoint genuinely translates + returns a real EPUB, but always into Serbian Cyrillic regardless of requested target. The FEATURE (FB2→translated-EPUB) is confirmed working; the hardcoded-target is an honest limitation note, not a bluff. Worth a tracked fix to honor the requested target.

Status.md row updates for the committer window (this agent does NOT commit)

Running headline before wave 5 (per Status.md Rev 14): **43 video-confirmed** (the prompt cited 46; the doc's own re-derivable count is 43 — going by what the doc proves per §11.4.6).

Net-new confirmations: +5 → new running total 43 + 5 = 48.

Suggested edits for the committer:

- Add to the Anti-bluff note: "Wave 5 of 2026-06-16 added **5 net-new** — EN→PT translate (helix_translate-en-pt-translate-wave5-20260616-173814.mp4), EN→JA translate (helix_translate-en-ja-translate-wave5-20260616-173814.mp4), –multipass polishing engine (helix_translate-multipass-polishing-

wave5-20260616-173814.mp4, Step 4  27s real polish, requires `-model deepseek-chat`; default `gpt-4` path BROKEN per §11.4.146), REST `POST /api/v1/convert/script` (`helix_translate-rest-convert-script-wave5-20260616-173814.mp4`), REST `POST /api/v1/translate/fb2` → real Serbian EPUB (`helix_translate-rest-translate-fb2-wave5-20260616-173814.mp4`, hardcoded `ru→sr` target). All `ffprobe+frame-verified` per §11.4.107 (790×560 yuv420p, ≥6 frames, output frame read). Running total 43 + 5 = **48**."

- Flip the Video-confirmed summary cell 43 → **48**.
- Row line 656 `api/handler.go` | `POST /api/v1/translate/fb2`: set Video-confirmation to `helix_translate-rest-translate-fb2-wave5-20260616-173814.mp4` (note: hardcoded `ru→sr` target).
- Row line 658 `api/handler.go` | `POST /api/v1/convert/script`: set Video-confirmation to `helix_translate-rest-convert-script-wave5-20260616-173814.mp4`.
- Add/flip the unified-translator `-multipass` row: Video-confirmation `helix_translate-multipass-polishing-wave5-20260616-173814.mp4` (caveat: requires explicit valid `-model`; default-model path broken — open a §11.4.146 bug item).
- Add the EN→PT and EN→JA language-pair confirmations under the unified-translator DeepSeek translate coverage.

Suggested new tracker items (committer to file)

1. **BUG (§11.4.146):** `-multipass` with default model `gpt-4` fails (`ValidModels` whitelist rejects it for `deepseek/most` providers) — `multipass` silently no-ops (base translation kept). Fix: default the polisher model to a provider-valid model, or bypass the whitelist on the polish path like the `BestModel/invoke` path does.
2. **BUG:** `POST /api/v1/translate/fb2` hardcodes `ru→sr` (`pkg/api/handler.go`: 84–85), ignoring `source_lang/target_lang` form fields. Fix: read the form fields and pass them through.
