§11.4.153 Real-Use Video Recording — WAVE 7

Revision: 1 Last modified: 2026-06-16T18:14:00Z

NON-COMMITTING parallel stream. Main checkout HEAD 0726c20. Real input → real DeepSeek (default in-process bridge, NOT -use-verifier) → real output. Each clip window-scoped (110×32 terminal pane, §11.4.154), `helix_translate-` prefix (§11.4.155), frames extracted + content-read (§11.4.107: source frame ≠ output frame). Prior `helix_translate-*` recordings NOT deleted (wave7 naming avoids collision per §11.4.154 same-scope rule).

CONFIRMED (4) — real video path + real output read

#	Feature	Binary / endpoint	Clip	Real result read from frame
1	EPUB→EPUB round-trip (EN→ES)	<code>unified-translator</code> <code>-i in.epub</code> <code>-o out.epub</code>	<code>helix_translate-epub-to-epub-en-es-wave7-20260616-181058.mp4</code>	EN "The old man walked along the shore at dawn..." → ES "El anciano caminaba por la orilla al amanecer..."; output verified EPUB document
3	Script conversion Cyrillic→Latin (pkg/script, NO LLM translation)	<code>unified-translator</code> <code>-script</code> <code>latin (sr→sr)</code>	<code>helix_translate-script-cyrillic-to-latin-wave7-20260616-181012.mp4</code>	"Добар дан свима...ђ...ц" → "Dobar dan svima...đ...dž"; zero Cyrillic remaining
4	preparation-translator analysis (characters/terminology/culture)	<code>preparation-translator</code> <code>-input ...</code> <code>-analysis ...</code>	<code>helix_translate-preparation-analysis-en-es-wave7-20260616-181123.mp4</code>	genre "science fiction"; subgenres space opera + military sci-fi; chars Sarah Mills (protagonist) /

#	Feature	Binary / endpoint	Clip	Real result read from frame
5	REST POST / api/v1/ translate/string (local ./build/server :8080)	curl → JSON	helix_translate-rest-translate-string-en-es-wave7-20260616-181155.mp4	Admiral Chen (antagonist); untranslatable terms Captain Sarah Mills, Admiral Chen, starship Aurora, New Geneva JSON translated_text = "Las montañas estaban cubiertas de nieve y el río fluía tranquilamente por el valle.", provider deepseek (NOT just session_id)

All 4: ffprobe advancing frames (3–4 read frames), yuv420p, even dims. Frame images in frames/.

FAILED / BROKEN (1) — real bug, NOT confirmed (§11.4.146 / §11.4.138)

markdown-translator EPUB→MD: empty-payload data loss → garbage output

```
markdown-translator -input w7_in.epub -output w7_md.md -format md -lang es -provider deepseek
```

- **Step 1 (EPUB→MD) is CORRECT:** source markdown contains real content — "# The Lighthouse", "The old man walked along the shore at dawn..." (see BUG_markdown_translator_source_was_correct.md).
- **Step 3 (translate) is BROKEN:** it sends EMPTY strings to DeepSeek per block. DeepSeek replies with its "It seems you may have accidentally sent an empty message..." boilerplate, which is written into the output AS IF it were the translation (see BUG_markdown_translator_garbage_output.md). The real chapter text is lost; output is unusable.
- Bridge source reported: in-process (confirms it is the real default path, NOT the unreachable verifier).
- Root cause (§11.4.102): markdown translation step feeds empty/whitespace segments to the LLM instead of the actual block content — markdown→translate payload-extraction defect, distinct from the markdown→EPUB round-trip fixes in prior commits.
- **NOT video-recorded as a confirmation** (would be a bluff video per §11.4.153). Captured text evidence committed here instead.

NET-NEW count

Reported separately because committed Status.md base is stale mid-edit (a separate committer agent is editing it; this stream did NOT read it). Against the wave 1–6 coverage stated in the dispatch (TXT translate; lang pairs FR/DE/IT/PT/JA/ZH/RU/SR; -multipass; HTML→HTML; PDF/DOCX input; REST /convert/script + /translate/fb2), all 4 confirmed features are DISTINCT:

- **NET-NEW confirmed: 4** (EPUB→EPUB round-trip; standalone -script Cyrillic→Latin; preparation-translator analysis pass; REST /api/v1/translate/string).
- **NET-NEW bug found: 1** (markdown-translator EPUB→MD empty-payload garbage).
