E2E Proof — DeepSeek allowlist unstaled (v4 models accepted)

Date: 2026-06-14 **Constitution:** §11.4.150 deep-research-per-issue, §11.4.99 latest-source, §11.4.123 rock-solid proof, §11.4.115 reproduce-first, §11.4.135 regression guard, §11.4.122 no silent removal

Defect

`ValidModels[ProviderDeepSeek]` listed only legacy `{deepseek-chat, deepseek-coder}`. `deepseek.go` HARD-REJECTS any unlisted model, so a user requesting the current DeepSeek flagship was rejected with "model 'deepseek-v4-pro' is not valid for DeepSeek" — a real user-impacting staleness defect.

Authoritative source (not memory — §11.4.99)

Live DeepSeek `/models` endpoint (verified 2026-06-14) — see `live_models.txt`:

```
deepseek-v4-flash  
deepseek-v4-pro
```

`deepseek-v4-flash` proven to genuinely translate this session ("Good morning" -> "Добро јутро", `finish_reason=stop`).

Fix

Added `deepseek-v4-flash` + `deepseek-v4-pro` to the allowlist (ONLY the two the live endpoint confirmed — `deepseek-reasoner` was NOT added since `/models` did not list it, per §11.4.6 no-guessing). Kept legacy `deepseek-chat/coder` (still work — §11.4.122).

Real-system proof (this directory)

`out.txt` — English PDF → real DeepSeek **deepseek-v4-flash** (the now-unblocked model) → Serbian Cyrillic, 136 Cyrillic chars:

| Храбри витез јахао је преко тихе долине у зору. ...

Regression guard (§11.4.135)

pkg/translator/llm/deepseek_v4_models_test.go asserts v4-flash + v4-pro accepted and deepseek-chat backcompat retained. RED proven pre-fix (both v4 rejected: "not valid for DeepSeek. Valid models: [deepseek-chat deepseek-coder]"); GREEN post-fix. Mutation = pre-fix allowlist.
