E2E proof — all 5 input formats → real DeepSeek → Serbian-Cyrillic EPUB (§11.4.83/§11.4.107/§11.4.25)

Revision: 1 **Last modified:** 2026-06-14T14:02:00Z

Real-system, anti-bluff proof that EVERY supported text input format translates end-to-end after this session's fixes. Each run: real .<fmt> asset → unified-translator → real DeepSeek (deepseek-chat) → valid EPUB; chapter text extracted + checked for Serbian Cyrillic, no source phrase, no placeholder.

This round also FIXED a real bug: FB2 and EPUB INPUT were broken end-to-end — the CLI's convertToMarkdown re-wrote already-extracted text to a temp .fb2/.epub and re-parsed it as that format ("failed to parse FB2: EOF" / "zip: not a valid zip"). Now all formats use the already-extracted content uniformly.

Input format	Provider	Exit	Cyrillic chars	Verdict
FB2	deepseek	0	101	PASS
EPUB	deepseek	0	123	PASS
TXT	deepseek	0	204	PASS
DOCX	deepseek	0	113	PASS
HTML	deepseek	0	128	PASS

Example (FB2): Гавран и врч ... Жедан гавран пронађе врч с мало воде на дну. Убацивао је каменчиће у врч, један по један...

Per-format extracted Serbian text: *_translated_sr.txt in this directory. Raw EPUB outputs: qa-results/e2e_matrix2_20260614T140151/ (git-ignored). No key leak (§11.4.10).
