E2E Proof — .html output format added (completes the output matrix)

Date: 2026-06-14 **Constitution:** §11.4 anti-bluff, §11.4.107 captured evidence, §11.4.135 regression guard, §11.4.146 extend-to-all-cases

Change

The output dispatcher (generateOutput) supported .epub/.fb2/.txt/.md and errored on .html, while the INPUT side fully supports HTML — an asymmetric gap. Added a .html/.htm case producing a minimal, valid, well-formed HTML5 document with HTML-escaped content (no markup injection from translated text).

Real-system proof (this directory)

English PDF → real DeepSeek deepseek-chat → out.html:

- file reports "HTML document text, UTF-8"
- `<!DOCTYPE html>` present, 2 `<p>` paragraphs, 140 Cyrillic chars
- NOT a zip (does not start with PK)
- real Serbian content: "Храбри витез јахао је преко тихог пропланка у зору. ..."
- run.log — translator log (no API-key printing)

Regression guard (§11.4.135)

cmd/unified-translator/output_format_test.go adds:

- "html is well-formed escaped HTML" — DOCTYPE +
+ content present, not a zip
- "html escapes content (no markup injection)" — raw
