meta_test_no_fakes_beyond_unit.sh — companion guide

Revision: 1 Last modified: 2026-06-14T00:00:00Z

Overview

Paired §1.1 mutation proof for the CM-N0-FAKES-BEYOND-UNIT gate in `scripts/pre_build_verification.sh`. PROVES the gate is not a bluff (§1.1 / §11.4.27): a non-unit (build-tagged) Go test importing a mock/stub path must FAIL the gate, while a unit test importing a mock must stay PASS.

Prerequisites

- `bash`, `git`, `grep`, `head` on PATH.

Usage

```
bash scripts/testing/meta_test_no_fakes_beyond_unit.sh
```

Exit codes: 0 gate proven sound · 1 gate is a bluff · 2 harness error.

Internal behaviour

Builds a disposable git repo under `mktemp`, pointed at the gate via `PBV_REPO_ROOT`; `tmp` dir removed via `trap` on every exit. Cases exercised:

1. baseline: a UNIT test (no build tag) importing `.../mocks` stays PASS — proves no false positive on units (§11.4.27 permits mocks in unit tests only).
2. an `//go:build` integration test importing `.../mocks` → FAIL → remove → PASS.
3. an `//go:build` e2e test importing `.../stubs` → FAIL → remove → PASS.

Edge cases / honest limitations

- The gate (and therefore this proof) is line-grep based, not AST-based; it detects import-path string literals. Mocks referenced indirectly are not caught. See `docs/scripts/pre_build_verification.sh.md` for the full limitation note.

Related scripts

- `scripts/pre_build_verification.sh` — the gate under test.

Last verified: 2026-06-14 (META-TEST RESULT: PASS).
