

CONTINUATION — HelixTranslate

session-resumption file

Revision: 4 **Last modified:** 2026-06-13T12:00:00Z **Purpose:** Single canonical out-of-the-box entry point for any fresh session (§11.4.131 / §12.10 / §11.4.127). To resume: point a new session at THIS file, run `git fetch --all`, and say **continue**.

SHORT resumption sentence

Read docs/CONTINUATION.md then `.remember/remember.md`, run `git fetch --all`, and **continue** the HelixTranslate “raise-to-enterprise” mandate at **Phase 4 (tests/Challenges/HelixQA to ~100% per type + expand real ebook-translation evidence)** while finishing the Phase-3 tail (Models decision, governance gaps). Binding: anti-bluff §11.4 (real captured evidence, no false PASS), no-force-push §11.4.113, flat snake_case submodules §11.4.28/§11.4.29, every change independently reviewed §11.4.142, containers-first infra §11.4.76, release tags prefixed helix_translate- (§11.4.151). Work subagent-driven (§11.4.70) with ≥ 3 parallel streams (§11.4.103).

Live state anchors (moment-valid)

- **Parent HEAD:** e775088 (batch W4/W5/W6/W8/W9/W10/W12 + llm_provider pointer bump) on main; pushed to BOTH milos85vasic/Translator + HelixDevelopment/HelixTranslate (verified at e775088, fast-forward, no force).
- **llm_provider HEAD:** b3dc7f9 (W7 CONST-036 propagation block + regenerated html/pdf), pushed to HelixDevelopment/LLMProvider master.
- **Constitution HEAD:** 5e671fe (§11.4.151 added), pushed to all 6 upstreams; parent pointer bumped.
- **Build:** `go build ./... = EXIT 0`. **Total test coverage = 50.7%** (`go tool cover -func total`; see docs/testing/coverage_matrix.md).
- **Submodules (flat, snake_case):** challenges containers constitution doc_processor docs_chain helix_qa llm_orchestrator llm_provider llms_verifier security vision_engine.
- **Release prefix:** HELIX_RELEASE_PREFIX=helix_translate (.env git-ignored, .env.example tracked). First RC: helix_translate-1.0.0-dev-0.0.1 — create ONLY when genuinely green (§11.4.40), operator-gated.
- **Safety backup:** ../helix_translate_gitbackup_20260611T181545Z/repo.git.mirror (pre-rename 311c585).

DONE

Phase 1 — flat snake_case submodules (reviewed GO, pushed): 8 submodules renamed; Go pkg challenges/→pkg/challenge_runner/; docs_chain added; .env release-prefix.go build ./... EXIT 0. **Phase 2 — constitution §11.4.151** release-prefix rule → pushed to all 6 constitution upstreams; parent pointer bumped; inheritance meta-test PASS. **Phase 3 (partial):** - Security/ plain dir → flat security submodule (proven byte-identical to upstream, zero loss; §11.4.124). - All submodules + main synced to every upstream (one stale containers gitlab mirror FF'd). - **docs_chain OPERATIONAL:** .docs_chain/contexts/tracked_docs.yaml registered; real pandoc+weasyprint sync produced docs/CONTINUATION.{html,pdf} + README.{html,pdf}; verify = in-sync. See docs/DOCS_CHAIN.md. - **Real translation PROVEN (anti-bluff):** EN→Serbian via DeepSeek deepseek-chat, 208 Cyrillic chars, differs from source, no placeholders. Evidence: qa-results/translation/<ts>/ (raw, git-ignored). Asset: test/assets/crow_and_pitcher_en.txt. - **Fixed a regression I introduced:** challenge scripts' PROJECT_ROOT="\${SCRIPT_DIR}/../.." broke when moved 1 level deeper → corrected to ../../..; 3 challenges re-verified PASS (cache_invalidation, model_verification_gate, anti_bluff step1-3).

CLOSED this session (2026-06-13, batch e775088 / llm_provider b3dc7f9 — all pushed, captured evidence)

- **W4**  pkg/security flaky Short-TTL — widened TTL→1min; 50× + -race + CPU-load all PASS.
- **W5**  pkg/distributed 120s timeout — bounded SMTP send (real defect) + in-process test servers; 3× ~48.5s, vet 0.
- **W6**  internal/verifier/discovery 600s timeout — injectable URLs (prod unchanged) + sentinel stub + honest SKIP; 3× ~1s, paired §1.1 mutation proven.
- **W7**  llm_provider CONST-036 propagation block — challenge GREEN; html/pdf regenerated.
- **W8**  anti_bluff_execution_challenge.sh BSD-sed — portable tmpfile sed (§11.4.67); isolated rc=0 proof.
- **W9**  tracked .bak/.backup residue — git-history-investigated (§11.4.124), removed + .gitignore; build 0.
- **W10**  -script latin→Cyrillic — pkg/script was never imported into unified-translator; normalizeScript wired; RED→GREEN 7 tests + 3×.
- **W12**  8 challenge scripts brittle root — git -C rev-parse --show-toplevel w/ fallback (§11.4.111); all parse:OK root:OK.

OPEN workable items (queue — many parallelizable, disjoint scope)

#	Item	Type	Notes / evidence
W1	Models/ divergent types.go (60-line		Convert needs preserving/

#	Item	Type	Notes / evidence
	lean LLMRequest, absent upstream)	Operator decision §11.4.122	discarding the local shape. Not consumed (no replace/import). DO NOT silently remove. Deferred — not blocking; surface to operator before W16.
W2	Coverage 50.7% → ~100% (§11.4.27); 27 pkgs at 0%	Task	cmd/unified- translator 1.8%, gRPC/ server 0%, sshworker 19.6%, storage 32.9%. Core translator pkgs healthy (77– 82%). Parallelizable per-package.
W3	Missing test types: chaos, ddos, scaling, ui, ux, full- automation (in- module)	Task	§11.4.85 chaos/ stress mandatory.
W11	Wire more docs_chain contexts (Issues/Fixed/Status once they exist)	Task	docs_chain proven operational.
W13	.gitmodules section labels still PascalCase	Task (cosmetic)	Needs per- submodule .git/ modules/* gitdir move.
W14	No project commit wrapper scripts/ commit_all.sh (§11.4.22)	Task	Multi-upstream push + sibling- doc checks (§11.4.75).
W15	Containers-first infra (§11.4.76) — run services via containers submodule	Feature	Phase 3/5.
W16	Convert Models/ →models submodule after W1 resolved	Task	Blocked on W1.
D1	docs_chain + security CONSTITUTION.md	Task	§11.4.118 discovery. They use §11.4.X cascade scheme

#	Item	Type	Notes / evidence
	lack literal CONST-036		(not CONST-NNN); challenge doesn't check them. Governance-design decision needed — do NOT blindly inject CONST-NNN (§11.4.6). §11.4.118 discovery + §11.4.50 determinism. One run reached step 4, another failed at step 2. Needs systematic-debugging (§11.4.102).
D2	Intermittent go test ./test/unit/... failure (surfaced by anti_bluff challenge step 2)	Bug	

NEXT phases (priority order)

- **Phase 4** — drive W2–W8 + W10: per-type test suites to ~100% (§11.4.27), real Challenges + HelixQA bank execution with captured evidence, expand real ebook translations (all formats, whole chapters, anti-bluff §11.4/§11.4.69). Subagent-driven, ≥ 3 parallel streams.
- **Phase 5** — containers-first infra (W15); docs_chain context expansion (W11); full docs (guides/diagrams/SQL/templates) + enterprise Website.
- **Phase 6** — RC tag helix_translate-1.0.0-dev-0.0.1 across all submodules + main ONLY when genuinely green (§11.4.40), operator-confirmed.

Binding constraints

Anti-bluff §11.4 (real captured evidence, no false PASS) · no-force-push §11.4.113 (merge-onto-latest-main) · multi-upstream push §2.1 · flat snake_case §11.4.28/§11.4.29 · every change independently reviewed §11.4.142 · host-safety §12 (no suspend/poweroff) · no silent component removal §11.4.122 · containers-first §11.4.76 · release prefix §11.4.151 · subagent-driven default §11.4.70 · ≥ 3 parallel streams §11.4.103.

Gotchas

- /Volumes/T7 is **case-sensitive HFS+** (NOT the internal disk — verify on the actual volume, §11.4.6).
- No scripts/commit_all.sh; stage explicit paths, never git add -A; never git add helix_qa (nested third-party pointer drift).

- PIPESTATUS empty in this shell (zsh); use \$? directly.
- Mutation challenges can leave .go.backup/.bak residue — scan + clean before commit (§11.4.84).
