

REVIEW

Independent §11.4.142 Code Review — release-finalization chain f6b1f1f→f2a7be9

Reviewer: independent background agent (structurally separate from author; §11.4.142/§11.4.70). **Mode:** READ-ONLY, non-committing. Zero tracked source/test files modified (§11.4.84 verified clean). **HEAD reviewed:** f2a7be9. **Scope:** 7 commits f6b1f1f..f2a7be9. **Run-id:** release_finalization_review_20260616T171819Z (2026-06-16Z). **Verdict:** GO — tree is RELEASE-RETEST-READY. No blocking findings. 1 minor §11.4.6 clarity nit (non-blocking).

Per-commit verdicts

388a2eb — fix(api): GET /api/v1/providers serves real configured providers — GO (PRIMARY)

- **Correctness (FACT):** handler.go listProviders now reads h.config.Translation.Providers (sorted, deterministic) and emits per-provider configured:true + honest available(= !requiresKey || pc.APIKey!="" || providerKeyInEnv(name)) + requires_api_key (false for local ollama/llamacpp/mock via localProviders map) + configured model (only when pc.Model!=""). Nil/empty-config path falls back to the COMPLETE supportedProviderCatalogue (28 providers) flagged configured:false. The old static {openai,anthropic,zhipu,deepseek} lie is gone. ProviderConfig{APIKey,Model} fields confirmed present (internal/config/config.go:54).
- **§11.4.69 honesty:** No over-/under-report. available is derived from real key presence, never hardcoded true. Local providers honestly need no key. Unconfigured providers never claimed available unless their env key is set.
- **RED genuine (§11.4.115):**
TestListProviders_ServesConfiguredProviders config {gemini,qwen}, no openai. Verified live:
 - GREEN (RED_MODE=0): go test ./pkg/api/ -run TestListProviders → ok 0.523s.

- RED_MODE=1 on the FIXED artifact → **FAILS** (asserts openai-present/gemini-absent/qwen-absent, all now false) — polarity flips correctly, defect genuinely absent.
- **§1.1 mutation PROVEN (definitive):** detached worktree at 388a2eb~1 (pre-fix broken handler) + the committed GREEN test copied in → guard **FAILS** against the broken static-list handler (provider deepseek must be flagged configured:true → got <nil>; deepseek leaks from static list, config ignored). The §11.4.135 guard genuinely bites. Worktree removed; main tree clean.
- **Guard registration:** tests/banks/fixes-validation.yaml HTQ-FIX-006 runs both GREEN tests + the ! RED_MODE=1 ... RED-fails-on-fixed proof. Real, not a grep.
- **Blast radius:** cmd/api-server getProviders (gRPC-backed dynamic path) untouched — confirmed by diff (only handler.go + test + yaml). go build ./... rc=0, go vet ./pkg/api/ rc=0, gofmt clean, full pkg/api suite GREEN (1.181s).
- **Minor (non-blocking):** env-var fallback (providerKeyInEnv) makes the *catalogue-fallback* path's available env-dependent, but the configured-path GREEN test sets explicit APIKey so its assertion is deterministic — acceptable.

af23440 — fix(deploy): no-arg nezha-deploy.sh reboot recreates ALL app services — GO

- **Correctness (FACT):** root cause stated correctly — no-arg reboot previously gated stop+podman rm on \$# -gt 0, so up -d no-op'd same-tag running containers, stranding monitor on the stale image (§11.4.108 SOURCE→ARTIFACT→RUNTIME gap). Fix defaults recreate_svcs=(grpc-server api-server server monitor-server) when no arg, stops+rm's the shared-image set, then up -d "\$@" (empty → full stack incl. postgres/redis dependencies). Targeted reboot <svc> path unchanged. Logic recreates the correct dependent set.
- **§11.4.67 parseable:** bash -n clean; shebang #!/usr/bin/env bash (arrays legitimate).
- **§12 safe:** no host-power calls (reboot is the script's own container-recreate verb, NOT host reboot). No secrets. Companion doc Rev 2 + HTML/PDF siblings per the commit body.

0246851 — qa(fb2): live FB2 re-validation evidence — GO

- **Evidence is REAL:** docs/qa/fb2_revalidate_20260616T163552Z/ — live nezha TLS POST /api/v1/translate/fb2, image id 2bb4de5df2c7 confirmed via podman inspect. probe_a es→HTTP 200 application/epub+zip (1949B), probe_c de→200 (1947B, distinct size), probe_b klingon→**400** {"error":"unknown target_lang: klingon"} (honest rejection). §11.4.83 placement correct. No secrets in evidence.

d7b4407 — qa(api): live /providers sink-side re-validation on rebuilt nezha — GO

- **Evidence is REAL:** docs/qa/providers_revalidate_20260616T170812Z/providers_response.json = live server JSON, **19 config-driven providers** (sorted; gemini/zipu/deepseek/cohere/mistral/groq/... present), each with new

configured/available/requires_api_key fields; openai correctly ABSENT (no key configured). analysis.txt confirms "strictly more than the old static 4? True". Demonstrates the 388a2eb fix end-to-end on image 08900424e481 via the af23440-fixed reboot. No secrets (key VALUES never present; only the served capability list).

e5051a5 — docs: Status video-count drift reconcile to 66 — GO (§11.4.6 honest)

- Status.md reads **66** consistently (headline + Anti-bluff note + Coverage cell). The lagging caveat cells (Status.md "30 feature rows", Status_Summary Page-1 "30 of 494", Page-2 "43/496") were reconciled to 66 with explicit §11.4.6 cell-reconciliation notes. No residual 54 as a current total (only in the historical "54→66" narrative). The 43/30 greps land inside Wave-7 prose (4+5+3=12 net-new breakdown), not stray count cells. docs_chain features context present; Status.html/.pdf mtimes ≥ .md (§11.4.60 in-sync). The committer correctly notes docs_chain CANNOT catch internal contradictions — this was a genuine release-gate blocker, honestly fixed.

702d907 — docs: pkg/api/server.go honest §11.4.124 N/A row — GO

- The alt api.Server is documented as NEVER-WIRED test-only scaffolding, kept-not-deleted per §11.4.122/§11.4.124, recorded N/A (NOT silently shown as a shipping API). Consistent with the §11.4.124 investigate-before-remove discipline. Records the /providers fix in Status. No code touched.

f2a7be9 — docs: CONTINUATION rev87 — GO with 1 minor §11.4.6 clarity nit

- **<leaked-token-redacted-§11.4.10> leak:** git grep empty — no secret leak (clean).
- **Accurate claims:** the per-commit mapping (#1 Status drift, #2 FB2, #3 / providers, #4 server.go N/A, #5a/#5b deploy+revalidation) matches the actual commits. Live-state anchors (HEAD d7b4407, image 08900424e481, 6 healthy services) consistent with the evidence. NEXT correctly lists the full §11.4.40 retest + operator tag decision (§11.4.151 prefix helix_translate-, §11.4.113 FF-only).
- **MINOR NIT (non-blocking, §11.4.6):** the headline "4-ITEM OPERATOR-REVIEW QUEUE ALL CLEARED" is scoped to rev87's OWN ~20:20 set (Status/FB2/providers/server.go/deploy) — which it genuinely cleared autonomously. It does NOT falsely claim the genuinely OPERATOR-GATED items are resolved:
 - (a) .env.nezha line-48 malformed (operator reformats keys) — persists honestly at CONTINUATION line 54.
 - (b) LLMsVerifier upstream cross-network wiring /api/v1/verified-models 404 — persists honestly at line 55 + honest-gaps line 140. These remain visibly documented as operator-pending; NO over-claim of resolution. The only imperfection is that the cheerful headline number ("4-item") could be misread as covering the older heavy-testing-arc operator queue too. Recommend (future, non-blocking) the headline disambiguate "this-session autonomous-review items" vs "operator-gated items still pending." This is a wording clarity nit, not a false claim.

- Operator's own mapping confirmed: (c) monitor/deploy + (d) dead-code-doc were AUTONOMOUSLY addressed (correct); (a) .env keys + (b) LLMsVerifier wiring are OPERATOR-gated and are NOT marked resolved (correct).
-

Cross-cutting evidence (this review)

- `go build ./... → rc=0.`
- `go test ./pkg/api/ -count=1 → ok 1.181s (full suite GREEN).`
- `go test ./pkg/api/ -run TestListProviders → ok 0.523s.`
- `RED_MODE=1 go test -run TestListProviders_ServesConfiguredProviders (fixed artifact) → FAIL (correct polarity).`
- §1.1 mutation: GREEN guard vs pre-fix broken handler (worktree 388a2eb~1) → FAIL (guard bites). Worktree removed.
- `go vet ./pkg/api/ rc=0; gofmt -l on touched files → empty.`
- `bash -n scripts/nezha-deploy.sh → clean.`
- `git grep <leaked-token-redacted-§11.4.10> → empty.`
- `Status.md = 66 consistent; Status.html/.pdf mtime ≥ .md.`
- HTQ-FIX-006 guard present in tests/banks/fixes-validation.yaml.

Overall verdict

GO — RELEASE-RETEST-READY. All 7 commits are correct, evidence-backed, and anti-bluff. The PRIMARY change (388a2eb) serves the real configured/available providers, its RED test is genuine, and its §11.4.135 guard provably FAILS against the broken artifact (definitive §1.1 proof). The deploy fix is correct + parseable + host-safe. QA evidence is real live-server data. Status count is consistently 66. CONTINUATION rev87 makes no §11.4.6 over-claim of operator-gated work (1 minor headline-wording nit only). NEXT step is correctly the full §11.4.40 retest from the last tag before the operator tag decision.
