

Bridge Phase-2 (no-local-runtime) “

§11.4.40 Full Retest Evidence

Run-id: bridge_phase2_retest_20260616 HEAD validated: f9c52a2 (main) Verdict: PASS “ build PRISTINE + TAG-READY

What shipped (bridge phase-2: LLMsVerifier-only, no local runtimes)

The CRITICAL operator mandate “ œno local llama.cpp/Ollama, only LLMsVerifier-obtained strongest models via a bridgeœ “ is fully implemented, sequenced P-1 † R-5, every step build-green + pushed + independently reviewed GO:

Step	Commit(s)	What	Review
P-1	e5307ce	bridge.BestClient adapter (llm.LLMClient, GetProviderName† ♦ ProviderID)	GO
P-1.5	86816a4	ProviderDiverse{Models,Clients,Translators} (strongest verified model per distinct provider “ operatorâ™s œprovider-diverseœ ♦ decision) + injectable ensemble factory seams	GO
R-1	9f6be23..35cb12c	Redirect 15 sites † bridge; R2 honest no-key hard-error; distributed API kept	GO
R-2	81a5fc7	Remove Ollama provider	GO
R-3	a21468e	Remove llama.cpp in-process provider	GO
R-4	c753559..8325f9d	Remove SSH-local path (4 cmd binaries, pkg/sshworker, llamacpp_provider, dead modelsbridge, local-runtime configs/scripts); wire R-1d; KEEP distributed API (operator decision) CM-N0-LOCAL-RUNTIME gate (option-A, default-path-only)	GO
R-5	102c773..f5f5fe5	+ meta-test; NITs; config.worker.json ollama† openai; §11.4.153 ledger 39 rows Obsolete; docs	GO
sweep-fix	09ca191..f9c52a2	Pristine pre-build sweep: doc-sibling-sync + force-push-gate self-false-positive + residual nits	“

Also reviewed GO: format-detection fix 5996e4b, verifier polarity 604c329.

§11.4.40 retest results (authoritative, main checkout HEAD f9c52a2)

- **Pre-build sweep:** SUMMARY: PASS “ all 9 gates green (incl.Â the new CM-N0-LOCAL-RUNTIME).
- **Build:** go build ./... exit 0.
- **Functional suite:** go test -count=1 ./... exit 0, **55 packages OK.**
- **Race:** go test -race ./... “ only test/distributed fails (documented pre-existing -race-only data race, §11.4.7-acceptable; passes without -race; R-4 touched no test/distributed file).

- **Meta-test mutation sweep (Â§1.1):** all scripts/testing/meta_test_*.sh bite (PASS) â€” incl.Â meta_test_no_local_runtime.sh (Mut1 re-add ProviderOllama â†’ Arm1 FAIL; Mut2 delete bridge prohibition â†’ Arm3 FAIL; Neg explicit-arm+comment+worker-config â†’ PASS).
- **Determinism (Â§11.4.50):** go test -count=3 ./pkg/bridge/... ./cmd/unified-translator/... exit 0.
- **Product challenges:** no_suspend_calls (source-clean) PASS, challenge_runner tests PASS.

Environment notes (NOT product defects, Â§11.4.6 honest classification)

- Two earlier retest runs FAILED in an isolated worktree â€” BOTH proven environment artifacts, not regressions: (1) git worktree add left submodules unpopulated â†’ replace ./challenges/.llms_verifier build collapse â†’ cascade; (2) worktree checkout mtime made CLAUDE.html/.pdf look â€œstaleâ€” to CM-DOC-SIBLING-SYNC. The SAME gate PASSES on the real main checkout (â€œevery in-scope tracked .md has fresh siblingsâ€”). Authoritative validation re-run on the real main checkout â†’ PASS.
- host_no_auto_suspend challenge FAILs: the **host** is not hardened against auto-suspend. This is an environment/host-config condition (Â§11.4.3), NOT a product defect. Per CONST-033 + zero-risk discipline, host power configuration was NOT changed autonomously overnight. Operator action item if host hardening is desired.

Tag readiness (DEFERRED to operator â€” 2 release-policy decisions, Â§11.4.6/Â§11.4.101)

The build is tag-ready but the first-ever release tag was NOT auto-created, because it hinges on two genuine policy decisions where guessing would violate zero-risk/zero-bluff: 1. **Version:** helix_translate-2.3.0 (current VERSION) vs a bump to 2.4.0 for the no-local-runtime milestone (Â§11.4.73). (Prefix helix_translate resolved from .env HELIX_RELEASE_PREFIX, Â§11.4.151. Zero existing tags.) 2. **Â§11.4.151 vs Â§11.4.119 conflict:** â€œtag every owned submoduleâ€” cannot include helix_qa (off-limits â€” another session owns it). The release submodule set needs operator blessing.

Tracked non-blocking follow-ups

- codebase_hash_report.json generator needs a submodule-exclusion before it can faithfully refresh (currently walks populated submodules â†’ scope explosion). Not a gate dependency.
- internal/working/config.distributed.{json,test,thinker}.json carry legacy llamacpp/gguf tokens â€” they belong to the KEPT distributed path; candidate for a future cycle if the distributed worker body is API-migrated to the bridge.
- Format detector XHTML-branch advisory (conservative false-FAIL edge case, zero real-tree impact) â€” optional future hardening.
